Step 1: Assemble the Faucet

Step 2: Position the Faucet

1. Place the gasket (if included) on the base of the faucet.

2. Insert the faucet into the mounting hole in the sink.
3. Ensure that the handle is positioned towards the front for easy access.

Step 3: Secure the Faucet

1. From underneath the sink, thread the mounting nuts onto the faucet shank.
2. Tighten the nuts by hand, and then use a basin wrench for additional security without over-tightening.

Step 4: Connect the Water Supply Lines

1. Identify the hot and cold water supply lines.
2. Attach the supply lines to the corresponding inlet on the faucet. Ensure you tighten them securely but avoid over-tightening, which can damage the fittings.
3. Use plumber's tape on the threads if necessary to prevent leaks.

Step 5: Install the Pull-Down Hose

1. Insert the pull-down hose through the faucet spout.
2. Connect the hose to the faucet body, ensuring it clicks into place.
3. Adjust the weight along the hose to ensure proper retraction.

Step 6: Turn On Water Supply

1. Slowly turn on the shut-off valves under the sink, starting with the cold water supply.
2. Check for leaks at all connection points. If any leaks are present, tighten the connections as needed.

Step 7: Test the Faucet

1. Turn on the faucet handle and check the water flow.
2. Switch between spray and stream modes to ensure proper functionality.
3. Observe for any leaks during operation. If leaks are detected, turn off the water supply and recheck the connections.
