1. Gather Your Materials

Make sure you have all the tools and materials listed above before starting the installation process. Having everything within reach will save you time and frustration.

2. Remove the Old Toilet

If you are replacing an old toilet, follow these steps:

1. Turn off the water supply: Locate the shut-off valve behind the toilet and turn it clockwise to stop the water flow.
2. Drain the tank: Flush the toilet to empty the tank. Use a sponge or towel to soak up any remaining water.
3. Disconnect the water supply line: Use an adjustable wrench to disconnect the water supply line from the bottom of the tank.
4. Remove the toilet: Unscrew the nuts holding the toilet to the floor (usually located under the caps at the base). Carefully lift the toilet off the flange and set it aside.
5. Clean the area: Ensure that the flange is clean and free of debris before proceeding with the new installation.

3. Inspect the Toilet Flange

Check the toilet flange for any signs of damage. If the flange is cracked or broken, it may need to be replaced before installing the new toilet.

Installing the Kohler K-46018-0 Toilet

Once you have prepared the area, it's time to install your new Kohler toilet.

1. Unbox and Prepare the Toilet

Carefully unbox the Kohler K-46018-0 toilet. Inspect it for any damage during shipping. Check that all components are included in the package:

- Toilet bowl and tank
- Wax seal
- Tank bolts and washers
- Seat and lid
- Mounting hardware

2. Install the Wax Seal

Place the wax seal on the toilet flange. Ensure it is centered and properly seated, as this will prevent leaks after installation.

3. Set the Toilet Bowl

Carefully lift the toilet bowl and align it with the flange. Lower the bowl onto the wax seal, ensuring that the mounting holes align with the bolts in the flange. Press down firmly to compress the wax seal.

4. Secure the Toilet Bowl

Use the nuts and washers provided to secure the toilet bowl to the flange. Tighten the nuts evenly with an adjustable wrench, being careful not to overtighten, as this can crack the porcelain.

5. Install the Tank

Next, it's time to install the tank. Place the rubber gasket on the bottom of the tank and position it over the bowl. Insert the tank bolts through the tank and into the bowl, securing them with washers and nuts. Tighten them evenly to ensure a proper seal.

6. Connect the Water Supply

Connect the water supply line to the bottom of the tank. Use plumber's tape on the threads to prevent leaks. Turn the shut-off valve counterclockwise to restore water supply.

7. Test for Leaks

Once everything is connected, turn on the water and allow the tank to fill. Flush the toilet and check for any leaks around the base and the tank. If you notice any leaks, tighten the connections as needed.

Finishing Touches

With the toilet installed, there are a few final steps to complete the setup.

1. Install the Toilet Seat

Attach the toilet seat according to the manufacturer's instructions. Typically, this involves aligning the seat with the holes on the bowl and securing it with the provided hardware.

2. Caulk the Base

To provide a finished look and prevent water from seeping under the toilet, apply a bead of caulk around the base of the toilet. Smooth it out with your finger or a caulking tool for a clean finish.

3. Clean Up

Remove any tools, packaging, and debris from the area. Wipe down the toilet with a gentle cleaner to remove any fingerprints or smudges.
