Overview of Two-Step Equations

Two-step equations are algebraic expressions that require exactly two operations to isolate the variable and solve the equation. These equations typically involve a combination of addition or subtraction and multiplication or division. Mastery of two-step equations is fundamental in algebra, serving as a building block for more complex problem-solving techniques.

Structure of Two-Step Equations

A standard two-step equation follows the form:

$$ax + b = c$$

Where a , b , and c are constants, and x is the variable to be solved. The goal is to perform inverse operations to isolate x on one side of the equation.

Steps to Solve Two-Step Equations

The typical process involves two sequential steps:

1. **Undo Addition or Subtraction:** Eliminate the constant term on the variable side by performing the opposite operation.
2. **Undo Multiplication or Division:** Isolate the variable by dividing or multiplying both sides of the equation by the coefficient of the variable.

For example, solving $3x + 5 = 11$ involves subtracting 5 from both sides, then dividing both sides by 3.
