Understanding the Menstrual Cycle

The menstrual cycle is a complex interplay of hormones that affects not only menstruation but overall health. Lara Briden emphasizes the importance of understanding this cycle to address various disorders.

The Phases of the Menstrual Cycle

The menstrual cycle can be divided into four distinct phases:

1. **Menstrual Phase:** This is when the uterine lining sheds, resulting in menstruation.
2. **Follicular Phase:** After menstruation, the body begins to prepare for ovulation, and estrogen levels rise.
3. **Ovulation:** The mature egg is released, which is the peak of fertility.
4. **Luteal Phase:** Following ovulation, the body prepares for a potential pregnancy, and progesterone levels increase.

By recognizing these phases, women can better understand their symptoms and how they relate to hormonal changes.
