DEFINITION AND BASIC CONCEPTS

WHAT ARE EIGENVALUES AND EIGENVECTORS?

IN LINEAR ALGEBRA, EIGENVALUES AND EIGENVECTORS ARE DEFINED IN THE CONTEXT OF SQUARE MATRICES AND LINEAR TRANSFORMATIONS. GIVEN A SQUARE MATRIX A , AN EIGENVECTOR IS A NONZERO VECTOR v SUCH THAT WHEN A ACTS ON v , THE OUTPUT IS A SCALAR MULTIPLE OF v . FORMALLY, THIS RELATIONSHIP IS EXPRESSED AS $A v = \lambda v$, WHERE λ IS A SCALAR CALLED THE EIGENVALUE CORRESPONDING TO THE EIGENVECTOR v . THE EIGENVALUE REPRESENTS THE FACTOR BY WHICH THE EIGENVECTOR IS SCALED DURING THE TRANSFORMATION.

GEOMETRIC INTERPRETATION

EIGENVECTORS CAN BE UNDERSTOOD GEOMETRICALLY AS DIRECTIONS IN THE VECTOR SPACE THAT REMAIN INVARIANT UNDER THE LINEAR TRANSFORMATION REPRESENTED BY MATRIX A . THE EIGENVALUES INDICATE HOW MUCH THE EIGENVECTORS ARE STRETCHED OR COMPRESSED. FOR EXAMPLE, IF AN EIGENVALUE IS GREATER THAN ONE, THE CORRESPONDING EIGENVECTOR IS STRETCHED; IF IT IS BETWEEN ZERO AND ONE, IT IS COMPRESSED. NEGATIVE EIGENVALUES IMPLY A REFLECTION IN ADDITION TO SCALING.

CHARACTERISTIC EQUATION

THE EIGENVALUES OF A MATRIX ARE FOUND BY SOLVING THE CHARACTERISTIC EQUATION, WHICH IS DERIVED FROM THE DETERMINANT OF THE MATRIX A MINUS A SCALAR MULTIPLE OF THE IDENTITY MATRIX I . THE CHARACTERISTIC EQUATION IS GIVEN BY:

$$\det(A - \lambda I) = 0$$

SOLVING THIS POLYNOMIAL EQUATION FOR λ YIELDS THE EIGENVALUES OF A . EACH EIGENVALUE MAY HAVE ONE OR MORE ASSOCIATED EIGENVECTORS.

COMPUTING EIGENVALUES AND EIGENVECTORS

STEP-BY-STEP COMPUTATION

COMPUTING EIGENVALUES AND EIGENVECTORS INVOLVES SEVERAL STEPS THAT START WITH FORMING THE CHARACTERISTIC POLYNOMIAL. FIRST, CALCULATE THE DETERMINANT OF $A - \lambda I$. THIS RESULTS IN A POLYNOMIAL IN TERMS OF λ . THE ROOTS OF THIS POLYNOMIAL ARE THE EIGENVALUES. ONCE EIGENVALUES ARE FOUND, SUBSTITUTE EACH EIGENVALUE BACK INTO THE EQUATION $(A - \lambda I)v = 0$ TO SOLVE FOR THE EIGENVECTORS. THIS STEP TYPICALLY INVOLVES SOLVING A SYSTEM OF LINEAR EQUATIONS.

EXAMPLE CALCULATION

CONSIDER A 2×2 MATRIX A :

- $A = \begin{bmatrix} 4 & 1 \\ 2 & 3 \end{bmatrix}$

TO FIND THE EIGENVALUES, SOLVE $\det(A - \lambda I) = 0$:

$$\det\left(\begin{bmatrix} 4 - \lambda & 1 \\ 2 & 3 - \lambda \end{bmatrix}\right) = (4 - \lambda)(3 - \lambda) - 2 = \lambda^2 - 7\lambda + 10 = 0$$

THE ROOTS OF $\lambda^2 - 7\lambda + 10$ ARE $\lambda = 5$ AND $\lambda = 2$. THESE ARE THE EIGENVALUES. TO FIND EIGENVECTORS, SUBSTITUTE $\lambda = 5$ INTO $(A - 5I)v = 0$ AND SOLVE FOR v . REPEAT FOR $\lambda = 2$.

NUMERICAL METHODS FOR LARGE MATRICES

FOR LARGE MATRICES, DIRECT COMPUTATION OF EIGENVALUES AND EIGENVECTORS CAN BE COMPUTATIONALLY EXPENSIVE. NUMERICAL ALGORITHMS SUCH AS THE QR ALGORITHM, POWER ITERATION, AND JACOBI METHOD ARE COMMONLY USED. THESE METHODS APPROXIMATE EIGENVALUES AND EIGENVECTORS EFFICIENTLY, WHICH IS ESSENTIAL IN FIELDS LIKE MACHINE LEARNING AND SCIENTIFIC COMPUTING.

PROPERTIES AND THEOREMS

KEY PROPERTIES OF EIGENVALUES AND EIGENVECTORS

EIGENVALUES AND EIGENVECTORS POSSESS SEVERAL IMPORTANT PROPERTIES THAT FACILITATE THEIR USE IN LINEAR ALGEBRA AND RELATED DISCIPLINES:

- THE SUM OF THE EIGENVALUES OF A MATRIX EQUALS THE TRACE OF THE MATRIX (SUM OF DIAGONAL ELEMENTS).
- THE PRODUCT OF THE EIGENVALUES EQUALS THE DETERMINANT OF THE MATRIX.
- IF A MATRIX IS SYMMETRIC, ALL ITS EIGENVALUES ARE REAL NUMBERS.
- EIGENVECTORS CORRESPONDING TO DISTINCT EIGENVALUES OF SYMMETRIC MATRICES ARE ORTHOGONAL.

DIAGONALIZATION

A MATRIX A IS DIAGONALIZABLE IF IT CAN BE EXPRESSED AS $A = PDP^{-1}$, WHERE D IS A DIAGONAL MATRIX WHOSE DIAGONAL ELEMENTS ARE EIGENVALUES OF A , AND P IS A MATRIX WHOSE COLUMNS ARE THE CORRESPONDING EIGENVECTORS. DIAGONALIZATION SIMPLIFIES MANY MATRIX COMPUTATIONS, SUCH AS RAISING MATRICES TO POWERS AND SOLVING DIFFERENTIAL EQUATIONS.

SPECTRAL THEOREM

THE SPECTRAL THEOREM STATES THAT ANY REAL SYMMETRIC MATRIX CAN BE DIAGONALIZED BY AN ORTHOGONAL MATRIX. THIS MEANS THAT SUCH MATRICES HAVE A FULL SET OF ORTHONORMAL EIGENVECTORS, AND THEIR EIGENVALUES ARE REAL. THIS THEOREM IS FOUNDATIONAL IN FIELDS LIKE QUANTUM MECHANICS AND VIBRATION ANALYSIS.

APPLICATIONS OF EIGENVALUES AND EIGENVECTORS

PRINCIPAL COMPONENT ANALYSIS (PCA)

PCA IS A STATISTICAL PROCEDURE THAT USES EIGENVALUES AND EIGENVECTORS OF THE COVARIANCE MATRIX OF A DATASET TO IDENTIFY THE DIRECTIONS (PRINCIPAL COMPONENTS) THAT MAXIMIZE VARIANCE. THIS TECHNIQUE REDUCES DIMENSIONALITY AND IS WIDELY USED IN DATA SCIENCE AND MACHINE LEARNING FOR FEATURE EXTRACTION AND VISUALIZATION.

STABILITY ANALYSIS IN SYSTEMS

IN CONTROL THEORY AND DIFFERENTIAL EQUATIONS, EIGENVALUES DETERMINE THE STABILITY OF EQUILIBRIUM POINTS. IF ALL EIGENVALUES OF THE SYSTEM MATRIX HAVE NEGATIVE REAL PARTS, THE SYSTEM IS STABLE. EIGENVECTORS PROVIDE THE DIRECTIONS ALONG WHICH THE SYSTEM EVOLVES.

QUANTUM MECHANICS

EIGENVALUES CORRESPOND TO OBSERVABLE QUANTITIES LIKE ENERGY LEVELS, WHILE EIGENVECTORS REPRESENT THE STATE VECTORS OF A QUANTUM SYSTEM. THE SCHRÖDINGER EQUATION IS FUNDAMENTALLY AN EIGENVALUE PROBLEM, MAKING THESE CONCEPTS ESSENTIAL IN PHYSICS.

OTHER APPLICATIONS

EIGENVALUES AND EIGENVECTORS ARE ALSO USED IN:

- GOOGLE'S PAGERANK ALGORITHM TO RANK WEB PAGES.
- MECHANICAL ENGINEERING FOR MODAL ANALYSIS OF STRUCTURES.
- ECONOMICS FOR ANALYZING INPUT-OUTPUT MODELS.

ADVANCED TOPICS IN EIGENVALUE PROBLEMS

GENERALIZED EIGENVALUE PROBLEM

THE GENERALIZED EIGENVALUE PROBLEM EXTENDS THE STANDARD EIGENVALUE PROBLEM TO TWO MATRICES A AND B , SEEKING SCALARS λ AND VECTORS v SUCH THAT $Av = \lambda Bv$. THIS FORMULATION ARISES IN APPLICATIONS WHERE TRANSFORMATIONS INVOLVE CONSTRAINTS OR WEIGHTED METRICS.

COMPLEX EIGENVALUES AND EIGENVECTORS

NOT ALL MATRICES HAVE REAL EIGENVALUES; SOME HAVE COMPLEX EIGENVALUES AND EIGENVECTORS. THIS OCCURS ESPECIALLY IN NON-SYMMETRIC OR NON-HERMITIAN MATRICES. COMPLEX EIGENVALUES OFTEN ARISE IN SYSTEMS WITH OSCILLATORY BEHAVIOR AND ARE HANDLED USING COMPLEX VECTOR SPACES.

JORDAN CANONICAL FORM

WHEN A MATRIX IS NOT DIAGONALIZABLE, IT CAN BE TRANSFORMED INTO ITS JORDAN CANONICAL FORM, WHICH GENERALIZES DIAGONALIZATION BY INCLUDING JORDAN BLOCKS. THIS FORM REVEALS THE STRUCTURE OF EIGENVALUES AND THE PRESENCE OF GENERALIZED EIGENVECTORS, PROVIDING DEEPER INSIGHT INTO THE MATRIX'S BEHAVIOR.

FREQUENTLY ASKED QUESTIONS

WHAT ARE EIGENVALUES AND EIGENVECTORS IN LINEAR ALGEBRA?

EIGENVALUES ARE SCALARS ASSOCIATED WITH A SQUARE MATRIX THAT INDICATE HOW THE MATRIX STRETCHES OR COMPRESSES VECTORS. EIGENVECTORS ARE NON-ZERO VECTORS THAT ONLY GET SCALED (NOT ROTATED) WHEN THE MATRIX IS APPLIED, SATISFYING THE EQUATION $Ax = \lambda x$, WHERE A IS THE MATRIX, x IS THE EIGENVECTOR, AND λ IS THE EIGENVALUE.

HOW DO YOU FIND THE EIGENVALUES OF A MATRIX?

TO FIND THE EIGENVALUES OF A MATRIX A , SOLVE THE CHARACTERISTIC EQUATION $\det(A - \lambda I) = 0$, WHERE I IS THE IDENTITY MATRIX AND λ REPRESENTS THE EIGENVALUES. THE SOLUTIONS λ ARE THE EIGENVALUES.

WHAT IS THE GEOMETRIC INTERPRETATION OF EIGENVECTORS?

EIGENVECTORS REPRESENT DIRECTIONS IN WHICH A LINEAR TRANSFORMATION ACTS BY STRETCHING OR COMPRESSING, WITHOUT CHANGING THE DIRECTION OF THE VECTOR. THEY INDICATE INVARIANT DIRECTIONS UNDER THE TRANSFORMATION REPRESENTED BY THE MATRIX.

WHY ARE EIGENVALUES AND EIGENVECTORS IMPORTANT?

EIGENVALUES AND EIGENVECTORS ARE FUNDAMENTAL IN MANY APPLICATIONS SUCH AS STABILITY ANALYSIS, VIBRATION ANALYSIS, FACIAL RECOGNITION, PRINCIPAL COMPONENT ANALYSIS (PCA), QUANTUM MECHANICS, AND DIFFERENTIAL EQUATIONS, BECAUSE THEY REVEAL INTRINSIC PROPERTIES OF LINEAR TRANSFORMATIONS.

CAN EIGENVALUES BE COMPLEX NUMBERS?

YES, EIGENVALUES CAN BE COMPLEX NUMBERS, ESPECIALLY WHEN THE MATRIX HAS COMPLEX ENTRIES OR IF THE MATRIX IS NOT SYMMETRIC. COMPLEX EIGENVALUES OFTEN OCCUR IN PAIRS OF CONJUGATES FOR REAL MATRICES.

WHAT IS THE DIFFERENCE BETWEEN EIGENVALUES AND SINGULAR VALUES?

EIGENVALUES ARE SCALARS ASSOCIATED WITH SQUARE MATRICES THAT SATISFY $Ax = \lambda x$, WHEREAS SINGULAR VALUES ARE ALWAYS NON-NEGATIVE REAL NUMBERS OBTAINED FROM THE SINGULAR VALUE DECOMPOSITION (SVD) OF ANY MATRIX, NOT NECESSARILY SQUARE, AND REPRESENT THE MAGNITUDE OF STRETCHING ALONG ORTHOGONAL DIRECTIONS.

HOW DO EIGENVECTORS RELATE TO DIAGONALIZATION?

A MATRIX IS DIAGONALIZABLE IF IT HAS ENOUGH LINEARLY INDEPENDENT EIGENVECTORS TO FORM A BASIS. IN THIS CASE, THE MATRIX CAN BE EXPRESSED AS PDP^{-1} , WHERE D IS A DIAGONAL MATRIX OF EIGENVALUES, AND P IS THE MATRIX WHOSE COLUMNS ARE THE CORRESPONDING EIGENVECTORS.

WHAT IS THE SIGNIFICANCE OF THE ALGEBRAIC AND GEOMETRIC MULTIPLICITY OF EIGENVALUES?

ALGEBRAIC MULTIPLICITY IS THE NUMBER OF TIMES AN EIGENVALUE APPEARS AS A ROOT OF THE CHARACTERISTIC POLYNOMIAL, WHILE GEOMETRIC MULTIPLICITY IS THE DIMENSION OF THE EIGENSPACE ASSOCIATED WITH THAT EIGENVALUE. THE GEOMETRIC MULTIPLICITY IS ALWAYS LESS THAN OR EQUAL TO THE ALGEBRAIC MULTIPLICITY AND DETERMINES WHETHER A MATRIX IS DIAGONALIZABLE.
