Understanding Linear Equations with One Variable

Linear equations with one variable are algebraic expressions set equal to each other, involving only one unknown value or variable. These equations take the general form $ax + b = c$, where a , b , and c are constants, and x is the variable to solve for. The goal is to isolate the variable on one side of the equation to find its value. This concept is fundamental in algebra as it introduces students to solving for unknowns and understanding equality and balance in equations.

Definition and Examples

A linear equation with one variable is defined as any equation that can be written in the form $ax + b = c$, where a , b , and c are real numbers and $a \neq 0$. For example, $3x + 5 = 11$ is a linear equation with one variable. Solving this involves subtracting 5 from both sides and then dividing by 3 to find $x = 2$. Other variations may include equations like $2x - 7 = 9$ or $5x = 20$.
