3. Connect Primary Wires:
 - Connect the L1 terminal to the 120V supply line (usually black wire).

- Connect the L2 terminal to the neutral wire (usually white wire).
- Connect the ground wire to the ground terminal on the transformer.

4. Connect Secondary Wires:

- Connect the R terminal to the common wire of your control circuit (usually blue or white).
- Connect the Y terminal to the air conditioning unit's compressor activation wire (usually yellow).
- Connect the W terminal to the heating unit's activation wire (usually white).
- Connect the G terminal to the fan control wire (usually green).

5. Secure Connections: Use wire connectors to secure all connections and wrap them with electrical tape to prevent accidental contact.

6. Test Connections: Before re-energizing the system, use a multimeter to check all connections for continuity and proper voltage.

7. Power Up: Once everything is securely connected and tested, turn the power back on at the circuit breaker.

8. Final Testing: Check the operation of the HVAC system to ensure that the transformer is functioning correctly.

Safety Considerations

Electrical work can be hazardous if not done correctly. Here are some safety tips to keep in mind while wiring the Mars 50327 transformer:

- Always Turn Off Power: Before touching any electrical components, ensure the power is completely turned off.
