What is Psychology?

Psychology is defined as the scientific study of the mind and behavior. It examines how individuals think, feel, and act, both individually and in groups. The field is diverse, incorporating various sub-disciplines, including:

- Operant Conditioning: Learning through reinforcement and punishment.
- Environmental Influence: The belief that behavior is shaped primarily by environmental factors.

3. Humanistic Psychology

Humanistic psychology, associated with figures like Carl Rogers and Abraham Maslow, emphasizes personal growth and self-actualization. Key concepts include:

- Self-Actualization: The realization of one's potential and the pursuit of personal growth.
- Unconditional Positive Regard: Acceptance and support regardless of circumstances.
- Maslow's Hierarchy of Needs: A model that categorizes human needs in a

pyramid structure, from basic physiological needs to self-actualization.

4. Cognitive Psychology

Cognitive psychology focuses on mental processes such as perception, memory, and problem-solving. Key areas of research include:

- Information Processing: How information is received, processed, and stored.
- Cognitive Biases: Systematic patterns of deviation from norm or rationality in judgment.
