DNA Replication

Animations of DNA replication demonstrate how the double helix unwinds and each strand serves as a template for the synthesis of a complementary strand. Key enzymes such as DNA helicase, primase, DNA polymerase, and ligase are depicted in action, showing their roles in strand separation, primer formation, nucleotide addition, and strand joining.

Transcription and RNA Processing

Transcription animations illustrate the process by which a segment of DNA is copied into messenger RNA (mRNA). These animations show the role of RNA polymerase, transcription factors, and the formation of the transcription complex. Subsequent RNA processing steps such as splicing, 5' capping, and polyadenylation are also visualized to explain how pre-mRNA matures into functional mRNA.

Translation and Protein Synthesis

The translation process is vividly represented in animations that depict the assembly of ribosomes on mRNA, the role of transfer RNA (tRNA) in delivering amino acids, and the stepwise elongation of polypeptide chains. Molecular biology of the gene animations highlight the genetic code and codon-anticodon interactions critical for accurate protein synthesis.

Gene Regulation Mechanisms

Animations also explore gene regulation at transcriptional and post-transcriptional levels. They demonstrate how repressors, activators, enhancers, and silencers influence gene expression. Epigenetic factors such as DNA methylation and histone modification are often included to show how gene activity can be modulated without altering DNA sequences.
