Introduction to Parasited Therapy

Parasited therapy is an emerging therapeutic model that combines psychological, emotional, and sometimes physiological interventions to treat diverse mental health issues. This approach is characterized by its focus on identifying and addressing underlying parasitic influences—metaphorical or literal—that affect an individual's mental well-being. The therapy is grounded in the belief that certain external or internal agents can interfere with a person's emotional and psychological balance, necessitating targeted interventions.

The term “parasited” in parasited therapy often refers to the concept of intrusive elements, such as negative thought patterns, trauma, or even physical parasites, that can disrupt normal functioning. By addressing these disturbances, the therapy aims to restore harmony and facilitate healing. Josephine Jackson and Sasha Rose are notable figures in the development and application of this therapy, each bringing a distinct perspective and methodology.

Jackson's Therapeutic Framework

Jackson's framework incorporates elements of cognitive-behavioral therapy, somatic experiencing, and holistic health practices.
