Step 1: Turn Off the Water Supply

- Locate the shut-off valves under the sink.
- Turn the valves clockwise to close them.

- Turn on the faucet to relieve any remaining pressure and drain the lines.

Step 2: Disassemble the Faucet

1. Use a screwdriver to remove the handle. Some handles have a decorative cap that needs to be pried off first.
2. Unscrew the retaining nut using an adjustable wrench.
3. Carefully pull out the cartridge or valve assembly.

Step 3: Inspect Components

- Cartridge: Check for cracks or wear. If damaged, replace it with a new one.

Step 4: Clean and Replace Parts

- Clean all components with a cloth and warm soapy water.

1. Insert the new or repaired cartridge back into the faucet body.

- Turn on the faucet to check for leaks. If everything is secure, you should not see any dripping.
