Understanding Projectile Motion

Projectile motion refers to the motion of an object that is projected into the air and is subject to gravitational force. It follows a curved path known as a trajectory, which can be analyzed using various physical principles. The key components of projectile motion include:

- **Initial Velocity:** The speed and direction at which the projectile is launched.
- **Angle of Projection:** The angle between the initial velocity vector and the horizontal axis.
- **Acceleration due to Gravity:** The constant acceleration acting downward, typically represented as 9.81 m/s^2 on Earth.
- **Time of Flight:** The total time the projectile remains in the air.
- **Range:** The horizontal distance traveled by the projectile.
- **Maximum Height:** The highest point reached by the projectile during its flight.

Understanding these components is crucial for solving problems related to projectile motion, which is where the PhET projectile motion simulation comes into play.
