Statistical Mechanics and Nonequilibrium Thermodynamics

Physical Kinetics Volume 10 integrates statistical mechanics with nonequilibrium thermodynamics to provide a unified understanding of kinetic phenomena. It addresses how statistical ensembles evolve and how thermodynamic quantities behave outside equilibrium, a subject central to many branches of physics and engineering.

Fluctuation-Dissipation Theorem

The fluctuation-dissipation theorem, a cornerstone in nonequilibrium physics, links spontaneous fluctuations within a system to its response to external perturbations. The volume presents a detailed derivation and applications of this theorem, highlighting its importance in describing relaxation processes.

Entropy Production and Irreversibility

Irreversibility and entropy production are fundamental concepts explaining why systems evolve toward equilibrium. The text explores these ideas quantitatively, showing how entropy production rates can be connected to transport coefficients and kinetic equations.
