Simple PIC Microcontroller Projects

Now that you have your tools ready, let's delve into some simple projects that are perfect for beginners.

1. Blinking LED

The blinking LED project is a classic starter project for any microcontroller platform. It helps you understand how to program the microcontroller and control output pins.

Steps:

1. Connect the Circuit:

- Place an LED on the breadboard.
- Connect the anode (long leg) to a digital output pin of the PIC.
- Connect the cathode (short leg) to ground through a resistor (220Ω).

2. Write the Code:

- Initialize the GPIO pin as an output.
- Use a loop to turn the LED on and off with a delay.

3. Upload and Test:

- Upload the program to the PIC and observe the LED blinking.

Example Code:

```
```\n#include\n\n#define _XTAL_FREQ 4000000 // Define the oscillator frequency\n\nvoid main() {\n    TRISB0 = 0; // Set RB0 as output\n    while (1) {\n        PORTBbits.RB0 = 1; // Turn LED on\n        __delay_ms(500); // Delay\n        PORTBbits.RB0 = 0; // Turn LED off\n        __delay_ms(500); // Delay\n    }\n}\n\\`\\`\\`
```

# 2. Temperature Sensor

This project introduces you to using sensors with PIC microcontrollers. You will use an LM35 temperature sensor to read and display temperature values.

Steps:

1. Connect the Circuit:

- Connect the LM35 sensor to an analog pin of the PIC.
- Use a potentiometer to adjust sensitivity if needed.

## 2. Write the Code:

- Set up the ADC (Analog-to-Digital Converter) to read the temperature.
- Convert the analog value to temperature in Celsius.

## 3. Display the Value:

- Use a simple LCD display or serial communication to output the temperature.

Example Code:

```
```\n#include\n\nvoid ADC_Init() {\n    ADCON0 = 0x01; // Select AN0\n    ADCON1 = 0x0E; // Set AN0 as analog\n}\n\nunsigned int Read_ADC() {\n    ADCON0bits.GO = 1; // Start conversion\n    while (ADCON0bits.GO); // Wait for conversion\n    return ((ADRESH <)\n\nvoid main() {\n    ADC_Init();\n    while (1) {\n        unsigned int temp = Read_ADC(); // Read temperature\n        // Display temp on an LCD or serial monitor\n    }\n}\n```\n
```

3. Light-sensitive LED

This project utilizes a photoresistor to control an LED based on ambient light levels. It introduces the concept of using input sensors to affect output.

Steps:

1. Connect the Circuit:

- Connect a photoresistor in series with a resistor to form a voltage divider.
- Connect the junction to an analog input pin of the PIC and connect the LED to an output pin.

2. Write the Code:

- Read the analog value from the photoresistor.
- Set the LED state based on the light level.

Example Code:

```

```c
include

void main() {
ADC_Init();
TRISB0 = 0; // Set RB0 as output
while (1) {
unsigned int lightLevel = Read_ADC(); // Read light level
if (lightLevel < threshold) {
PORTBbits.RB0 = 1; // Turn on LED
} else {
PORTBbits.RB0 = 0; // Turn off LED
}
}
}
}
```

```

4. Simple Motor Control

In this project, you will learn how to control a DC motor with a PIC microcontroller using a transistor as a switch.

Steps:

1. Connect the Circuit:

- Connect the motor through a transistor (e.g., NPN) to control it via a digital output pin.
- Use a diode across the motor terminals to protect against back EMF.

2. Write the Code:

- Control the motor on and off through the output pin.

Example Code:

```

```c
include

void main() {
TRISB0 = 0; // Set RB0 as output
while (1) {
PORTBbits.RB0 = 1; // Turn motor on
__delay_ms(1000); // Run for 1 second
PORTBbits.RB0 = 0; // Turn motor off
__delay_ms(1000); // Wait for 1 second
}
}
}
```

```

5. Digital Dice

Create an electronic dice using a PIC microcontroller that displays a random number on an LED display or turns on a corresponding number of LEDs.

Steps:

1. Connect the Circuit:

- Connect six LEDs to output pins, each representing a face of the dice.
- Use a button to "roll" the dice.

2. Write the Code:

- Generate a random number between 1 and 6 when the button is pressed.
- Light up the corresponding number of LEDs.

Example Code:

```
```\n#include\n#include\n\nvoid main() {\n    TRISB = 0; // Set PORTB as output\n    while (1) {\n        if (BUTTON_PRESSED) {\n            int diceValue = rand() % 6 + 1; // Generate random number\n            PORTB = (1 <}\n        }\n    }\n    \\\n
```
