Understanding the Predictive Index

The Predictive Index (PI) is a behavioral assessment tool designed to help organizations understand the motivations, needs, and drives of their employees and candidates. Developed in the 1950s, the PI has evolved into a comprehensive assessment that provides valuable insights into how individuals will behave in various work environments. The assessment typically involves a simple questionnaire that measures four primary behavioral drives:

1. Dominance - The drive to exert influence on others and control one's environment.
2. Extraversion - The drive to connect with others, socialize, and engage in teamwork.
3. Patience - The drive for stability, consistency, and the ability to work well under pressure.
4. Formality - The drive for structure, rules, and adherence to processes and procedures.

These four drives combine to form a behavioral pattern unique to each individual, which can be used to assess fit for specific roles, predict job performance, and improve team dynamics.

Types of Predictive Index Behavioral Assessments

The Predictive Index offers various assessment types to cater to different organizational needs. These assessments can be broadly categorized into two main types:

1. The Predictive Index Behavioral Assessment

The Predictive Index Behavioral Assessment is the core assessment tool used to evaluate an individual's behavioral traits. This assessment is typically completed in 10 minutes or less and involves two parts:

- **Self-Assessment:** The participant chooses adjectives that they feel describe themselves best.

- **Job Assessment:** The participant chooses adjectives that they believe are necessary for success in a specific job role.

This dual approach allows organizations to compare individual behavioral profiles against the requirements of specific roles, creating a clearer understanding of fit and potential.

2. The Predictive Index Job Assessment

The Predictive Index Job Assessment is designed for employers to define the behavioral requirements of a specific job. By conducting this assessment, organizations can create a job model that outlines the ideal behavioral traits needed for success in that position. The job assessment is typically completed using a structured process that involves:

- **Job Analysis:** Collaborating with key stakeholders to identify the core responsibilities and expectations of the role.
- **Behavioral Profiling:** Comparing the behavioral patterns of successful employees in similar roles to establish a benchmark for hiring.

This assessment is particularly useful for organizations looking to refine their hiring processes and ensure that new hires align with the company's culture and job requirements.
