Notable Princeton Problems and Solutions

Here, we will outline several classic Princeton problems and provide step-by-step solutions.

Problem 1: The Pendulum

Problem Statement: A simple pendulum of length (L) is displaced to a small angle (θ) and released from rest. Calculate the period of the pendulum for small oscillations.

Solution:

1. The equation of motion for the pendulum can be derived from Newton's second law or using energy methods. For small angles, we can approximate $(\sin(\theta) \approx \theta)$.
2. The restoring force can be expressed as:
$$F = -mg\sin(\theta) \approx -mg\theta$$

3. The equation of motion becomes:

$$mL \frac{d^2 \theta}{dt^2} = -mg \theta$$

Simplifying gives:

$$\frac{d^2 \theta}{dt^2} + \frac{g}{L} \theta = 0$$

4. This is a simple harmonic motion equation with the solution:

$$\theta(t) = \theta_0 \cos\left(\sqrt{\frac{g}{L}} t\right)$$

5. The period (T) of the pendulum is given by:

$$T = 2\pi \sqrt{\frac{L}{g}}$$

Problem 2: Electric Field of a Charged Disk

Problem Statement: Consider a uniformly charged disk of radius (R) and surface charge density (σ) . Calculate the electric field at a point along the axis of the disk, a distance (z) from its center.

Solution:

1. The electric field (dE) produced by an infinitesimal ring of radius (r) and thickness (dr) on the disk is given by:

$$dE = \frac{1}{4\pi\epsilon_0} \frac{\sigma(2\pi r dr)}{(r^2 + z^2)} \cos(\theta)$$

where $(\cos(\theta) = \frac{z}{\sqrt{r^2 + z^2}})$.

2. The total electric field is obtained by integrating over the disk:

$$E = \int_0^R dE = \int_0^R \frac{\sigma r}{2\epsilon_0 (r^2 + z^2)^{3/2}} z dr$$

3. Evaluating this integral using the substitution $(u = r^2 + z^2)$ yields:

$$E = \frac{\sigma}{2\epsilon_0} \left(1 - \frac{z}{\sqrt{R^2 + z^2}}\right)$$

Problem 3: Heat Transfer in a Rod

Problem Statement: A long rod of length (L) is insulated except for its ends, which are kept at temperatures (T_1) and (T_2) respectively. Assuming steady-state heat conduction, find the temperature distribution along the rod.

Solution:

1. The heat conduction equation in one dimension is given by Fourier's law:

$$\frac{d^2T}{dx^2} = 0$$

2. Integrating this equation once gives:

$$\frac{dT}{dx} = C_1$$

where (C_1) is a constant.

3. Integrating again yields:

$$T(x) = C_1 x + C_0$$

4. To find (C_1) and (C_0) , we apply the boundary conditions:

- At $(x = 0, T(0) = T_1)$
- At $(x = L, T(L) = T_2)$

This provides us with two equations:

$$T(0) = C_0 = T_1$$

$$T(L) = C_1 L + T_1 = T_2$$

5. Solving for (C_1) :

$$C_1 = \frac{T_2 - T_1}{L}$$

6. The temperature distribution along the rod is then:

$$T(x) = \frac{T_2 - T_1}{L} x + T_1$$
