Overview of Learning and Conditioning

The study of learning and conditioning is a cornerstone of the psy 101 exam 3 curriculum. This section explores how organisms acquire new behaviors through interaction with their environment. Understanding the principles of classical and operant conditioning is essential for grasping how behaviors are learned and maintained.

Classical Conditioning

Classical conditioning, first described by Ivan Pavlov, involves learning through association. A neutral stimulus becomes associated with an unconditioned stimulus to elicit a conditioned response. Key components include the unconditioned stimulus (US), unconditioned response (UR), conditioned stimulus (CS), and conditioned response (CR). This process explains various learned behaviors and emotional responses.

Operant Conditioning

Operant conditioning, developed by B.F. Skinner, focuses on how consequences shape behavior. Reinforcements increase the likelihood of a behavior, while punishments decrease it. Understanding positive and negative reinforcement, as well as different schedules of reinforcement, is crucial for the exam.

Observational Learning

Observational learning, or modeling, involves acquiring behaviors by watching others. Albert Bandura's social learning theory emphasizes the role of attention, retention, reproduction, and motivation in learning through observation. This concept expands the traditional behaviorist framework.

Memory Systems and Processes

Memory is a complex cognitive function covered extensively in psy 101 exam 3. This section addresses how information is encoded, stored, and retrieved, including the different types of memory systems and the factors influencing memory performance.

Sensory, Short-Term, and Long-Term Memory

Memory is typically divided into sensory memory, short-term memory (STM), and long-term memory (LTM). Sensory memory briefly holds sensory information, STM maintains limited information temporarily, and LTM stores information more permanently. The characteristics and capacities of each system are vital knowledge areas.

Encoding and Retrieval

Encoding refers to the process of transforming sensory input into a form that can be stored in memory. Retrieval involves accessing stored memories. Various factors such as context, cues, and interference affect retrieval success. Understanding these processes helps explain why forgetting occurs.

Types of Long-Term Memory

Long-term memory is subdivided into explicit (declarative) memory, which includes episodic and semantic memory, and implicit (non-declarative) memory, such as procedural memory. These distinctions highlight different ways information is stored and used.

Cognitive Psychology and Problem Solving

Cognitive psychology focuses on mental processes including perception, attention, language, and problem solving, all prominent topics in psy 101 exam 3. This section delves into how people think, reason, and make decisions.

Information Processing Model

The information processing model compares the mind to a computer, describing how information is taken in, processed, stored, and outputted. This framework is fundamental for understanding cognition and memory processes.

Problem Solving Strategies

Problem solving involves identifying solutions through methods such as algorithms, heuristics, and insight. Each strategy has advantages and limitations, and understanding these helps explain human decision-making behavior.

Decision Making and Cognitive Biases

Decision making is influenced by heuristics and biases, which can lead to systematic errors. Common biases include confirmation bias, availability heuristic, and anchoring. Recognizing these biases is important for understanding human thought processes.

Psychological Disorders and Diagnosis

Psychological disorders and their diagnostic criteria form a significant portion of psy 101 exam 3. This section outlines major mental health disorders, their symptoms, and classification systems used in psychology.

Classification Systems: DSM-5

The Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5), is the standard classification tool for mental disorders. It provides criteria for diagnosis and is essential knowledge for understanding psychological disorders.

Major Psychological Disorders

Key disorders include anxiety disorders, mood disorders, schizophrenia, and personality disorders. Each disorder has characteristic symptoms and diagnostic features that students must be familiar with.

Causes and Treatments

Psychological disorders arise from a combination of genetic, biological, environmental, and psychological factors. Treatment approaches vary from psychotherapy to pharmacological interventions, and an understanding of these is critical for the exam.

Effective Study Strategies for psy 101 exam 3

Successful preparation for psy 101 exam 3 involves strategic study methods tailored to the content's complexity. This section highlights evidence-based techniques to enhance retention and comprehension.

Active Recall and Spaced Repetition

Active recall involves testing oneself on material rather than passive review. Spaced repetition spreads study sessions over time, improving long-term retention. These methods are highly effective for mastering psychology content.

Utilizing Practice Exams

Practice exams simulate the test environment and help identify knowledge gaps. Reviewing answers and understanding mistakes are crucial steps in preparation.

Organizing Study Material

Creating outlines, concept maps, and summaries aids in organizing information logically. Group study sessions can also promote discussion and deeper understanding.

1. Review lecture notes regularly.
2. Create flashcards for key terms and concepts.
3. Engage in group discussions to reinforce learning.
4. Take timed practice tests to build exam endurance.
5. Focus on understanding rather than memorization.
