Introduction to Sabre and Its Interface

Understanding the Sabre system's core interface is fundamental before diving into specific commands. Sabre is a widely adopted Global Distribution System that connects travel agents, airlines, and service providers worldwide. It operates primarily through a command-line interface, allowing users to input specific commands to perform tasks such as flight searches, bookings, cancellations, and ticketing. The interface is designed for speed and accuracy, with commands typically consisting of abbreviations, codes, and numerical entries.

Sabre's command syntax requires familiarity with airline codes, airport codes, class of service, and date formats. The system's efficiency lies in its structured command input, enabling rapid transaction processing. This section provides an overview of the interface layout and key terminology to aid comprehension of subsequent commands in this cheat sheet.

Sabre Terminal Layout

The Sabre terminal displays command input lines, system responses, and notifications in a sequential format. Users enter commands in the command line, and the system returns outputs such as flight availability or PNR details. The terminal supports multiple sessions, allowing agents to manage

several bookings simultaneously. Understanding how to navigate the terminal, including scrolling and command recall, is crucial for effective system use.

Common Abbreviations and Codes

Mastering standard abbreviations is vital for interpreting and composing Sabre commands. Key codes include airport codes (IATA 3-letter codes like JFK for John F. Kennedy International Airport), airline designators (e.g., AA for American Airlines), and class of service letters (Y for Economy, J for Business). Dates are typically entered in DMMM format (e.g., 15DEC). These codes form the building blocks of most commands, making their comprehension essential.

Basic Sabre Commands for Flight Booking

Booking flights is the primary function of Sabre, and a solid grasp of basic commands expedites this process. From searching for availability to creating passenger name records (PNRs), these commands form the foundation of travel reservations.

Flight Availability Search

To find available flights, Sabre users input commands specifying departure and arrival cities, dates, and class of service. The general format follows: `1[origin][destination][date][class]`. For example, `1NYCLON15DECY` searches for economy flights from New York City to London on December 15.

- **1**: Command to display availability
- **NYC**: Origin airport code
- **LON**: Destination airport code
- **15DEC**: Travel date
- **Y**: Class of service (Economy)

Creating a Passenger Name Record (PNR)

After selecting flights, agents create a PNR to hold the booking information. This involves entering passenger details, contact information, and flight segments. The command to add a passenger is typically `NM1SMITH/JOHN MR`, which adds one passenger named John Smith with the title Mr. Flight segments are added using segment commands derived from availability results, often with line numbers indicating the chosen flight.

Queueing and Saving Bookings

Once the PNR is complete, it can be saved and queued for ticketing or further processing. The `ER` command ends the transaction and saves the record.

Queueing commands, such as *QS*, place the PNR in specific queues for agent follow-up or ticket issuance, streamlining workflow management.

Reservation Management Commands

Managing existing reservations is a critical aspect of Sabre use. This includes modifying itineraries, canceling segments, and retrieving PNRs for review or update. Efficient use of these commands ensures accurate passenger data and up-to-date travel information.

Retrieving a PNR

To access an existing reservation, agents use the record locator or passenger name. The command **ABC123* retrieves a PNR by its record locator, while **SMITH/JOHN* searches by passenger name. Once retrieved, the PNR details can be reviewed and edited.

Modifying Flight Segments

Changing or canceling flight segments involves specific commands. To cancel a segment, the format is *XE[segment number]*. For example, *XE2* cancels the second segment in the itinerary. Adding a new segment follows the same syntax as booking but includes the segment number designation.

Adding Remarks and Contact Information

Remarks provide special instructions or notes within the PNR. The command *5.RMK [text]* adds a remark. Contact information such as phone numbers is added using *AP [area code][number]*. Keeping PNRs updated with remarks and contacts is essential for operational clarity and communication.

Ticketing and Fare Commands

The ticketing process in Sabre involves fare quoting, fare rules retrieval, and ticket issuance. This section outlines the commands that facilitate these critical steps, ensuring compliance with airline policies and accurate fare application.

Fare Quote Commands

Fare quotes provide pricing information for selected flights and classes of service. The command *FQ* followed by the itinerary details generates fare quotes. For example, *FQ NYCLON* quotes fares for flights between New York City and London. Additional parameters can specify passenger type and fare basis codes.

Displaying Fare Rules

Fare rules explain restrictions and conditions associated with a ticket. The command `FR[fare basis code]` displays these rules. Understanding fare restrictions helps agents advise clients accurately and ensure fare compliance.

Ticket Issuance

Issuing tickets requires finalizing the booking and processing payment. The `W` command is commonly used to queue the PNR for ticketing, while `TTP` issues the electronic ticket. Ticketing commands vary depending on airline and agency configurations but generally follow this structure.

Passenger and PNR Information Commands

Accessing detailed passenger and itinerary information is vital for verification and service delivery. Sabre provides commands to display passenger data, itinerary summaries, and special service requests (SSRs).

Displaying Passenger Details

The command `*P` shows passenger information within the PNR, including names, titles, and contact details. This overview facilitates quick identification and communication with travelers.

Viewing Itinerary and Segment Status

To review the full itinerary and segment status, the `*I` command is used. This displays all flight segments, their statuses (confirmed, waitlisted, canceled), and associated details like departure times and terminals.

Special Service Requests (SSRs)

SSRs include requests for special meals, wheelchair assistance, or other services. Adding SSRs involves commands like `3SSR OTHS 1/PAX`, where the code and passenger number specify the request. Managing SSRs ensures passengers' needs are accommodated properly.

Advanced Sabre Commands and Tips

Beyond basic operations, advanced Sabre commands enhance productivity and troubleshoot common issues. This section highlights useful commands and best practices for experienced users seeking to optimize Sabre usage.

Command Shortcuts and Abbreviations

Sabre supports numerous shortcuts that reduce keystrokes and speed up processes. For instance, using segment line numbers instead of full flight details when modifying bookings or employing abbreviated commands for frequent tasks. Familiarity with these shortcuts significantly improves efficiency.

Error Handling and Common Pitfalls

Users may encounter errors such as invalid commands or unavailable flights. Recognizing error messages and knowing corrective commands like *ER* to end and save, or *IG* to ignore a line, helps maintain workflow continuity.

Using Sabre Reports and Queue Management

Advanced users often manage queues to organize tasks and PNRs awaiting action. Commands like *QH* display queue headers, while *QSP* shows specific queue contents. Efficient queue management optimizes workload distribution and follow-up.

Customizing Sabre Settings

Sabre allows customization of display formats, default values, and user preferences through commands such as *WD* to change display settings. Tailoring the interface to individual needs enhances usability and comfort during long operational hours.
